

PHYSICAL OCEANOGRAPHY OF THE GULF OF MAINE

By HENRY B. BIGELOW

Museum of Comparative Zoology, Harvard University

With the collaboration of R. Parmenter and E. H. Smith

CONTENTS

	Page		Page
Introduction	513	Temperature—Continued.	
Oceanographic history	513	July and August—Continued.	
1. Gulf of Maine proper	513	100 meters	610
2. Continental shelf south of Nantucket and Marthas Vineyard	517	150 meters and deeper	613
Topography	518	Profiles	615
Depth of the gulf	519	Bottom	624
Banks and sinks		Annual variations in summer temper-	
Watershed		ature	626
Temperature		Autumnal cooling	636
February and March		Surface	636
Surface		Subsurface	638
Vertical distribution		November and December	645
40 meters		Mid-winter	651
100 meters and deeper		Thermal summaries	662
Profiles		1. Mouth of Massachusetts Bay, off Gloucester	662
Bottom		2. Bay of Fundy	664
Annual variations in temperature in early spring	543	3. Near Mount Desert Island	665
Vernal warming	546	4. Western side of the basin	665
April	550	Relationship between the temperature of the surface and of the air	668
May	556	Factors governing the temperature of the Gulf of Maine	674
Surface	556	Solar warming	674
Below the surface	564	Dispersal of heat downward into the water	678
June		Thermal effects of upwellings	679
Rate of warming		Thermal effects of horizontal circulation of the gulf	679
General distribution of temperature		Thermal effects of evaporation	680
July and August		Thermal effects of the Nova Scotian current	680
Surface		Thermal effects of the slope water	690
Temperature gradient in the upper 100 meters	585	Winter chilling	692
Temperature gradient in depths greater than 100 meters	596	Table of normal air temperatures	695
Temperature gradient on the offshore banks	602	Chilling effect of melting snow	696
Temperature gradient along the con- tinental edge	604	Chilling effect of melting ice	697
40 meters	605	Thermal effect of river water	699
	607	Summary of thermal determinants	701

	Page		Page
Salinity -----	701	Sources from which the Gulf of Maine receives its waters—Continued.	
General summary-----	701	Deep stratum-----	842
Detailed account of salinity-----	703	Slope water-----	842
February and March-----	703	Abyssal upwellings-----	852
Surface-----	703	Recapitulation-----	854
Vertical distribution-----	705	Circulation in the Gulf of Maine-----	855
40 meters-----	708	Tidal currents-----	855
100 meters-----	710	Dominant or nontidal drift-----	857
150 meters and deeper-----	712	Measurements of currents-----	857
Profiles-----	714	Summary-----	866
Limits of water more saline than 34 per mille-----	720	Experiments with drift bottles-----	867
Bottom-----	720	Bay of Fundy-----	868
Annual variations in salinity in March-----	722	Gulf of Maine-----	871
Vernal freshening-----	723	Drift-bottle record-----	871
Vertical distribution of salinity in April-----	728	General discussion of the recoveries-----	879
Salinity below the surface in April-----	733	Southwestern series-----	879
Annual variations in the salinity of the bottom water in April-----	740	Recoveries from Cape Ann and Massachusetts Bay lines-----	887
May-----	741	Drifts of bottles set out north of Cape Ann and off Cape Elizabeth-----	895
Surface-----	741	Line off Mount Desert, August, 1923-----	902
Below the surface-----	746	Bottles put out off western Nova Scotia-----	908
June-----	754	Drifts of bottles entering the gulf from the eastward-----	908
July and August-----	763	Circulation of superficial stratum, as indicated by salinity-----	910
Surface-----	763	Circulation of the superficial stratum, as indicated by temperature-----	918
Annual variations in surface salinity in summer-----	771	Circulation in the deep strata, as indicated by temperature and salinity-----	921
Vertical distribution-----	772	Circulation as indicated by the plankton-----	923
General distribution of salinity below the surface-----	781	Vertical stability, as affecting the circulation of the gulf-----	924
Autumn and early winter-----	799	Dynamic evidences of circulation-----	930
Midwinter-----	804	Construction of dynamic charts-----	930
Summaries of salinity for representative localities-----	808	Dynamic contours and gradient currents-----	936
Bay of Fundy-----	808	February and March-----	936
Massachusetts Bay region-----	810	April-----	942
Offing of the Merrimack River-----	813	May-----	944
Near Mount Desert Island-----	813	June-----	948
German Bank-----	814	July and August-----	953
Western side of the basin-----	814	Autumn and winter-----	962
Annual survey of salinity on the bottom-----	815	Wind currents-----	962
Alkalinity-----	819	Horizontal tidal oscillations as deflected by the earth's rotation-----	970
Visual transparency-----	822	Summary of the horizontal, nontidal circulation of the Gulf of Maine-----	972
Color-----	823	Tables of temperature, salinity, and density-----	976
Sources from which the Gulf of Maine receives its waters-----	824	Standards of accuracy-----	976
Superficial stratum-----	825	Bibliography-----	1015
Nova Scotian current-----	825		
Tropic water-----	836		
Coastal water from the west-----	837		
River water-----	837		
Rainfall and evaporation-----	840
